

INSECTS TRAPS

FEROTRAP®

Glue board for stored food insects

CHARACTERISTICS

Ferotrap is a glue board for monitoring Pyraloidea Moths (*Ephestia kuehniella*, *Plodia interpunctella*) and Moth of the clothes (*Tineola bisselliella*).

The glue board has to be activated with the proper pheromone.

Ferotrap is easy and quick to activate. The inner side has black stripes on white board, to facilitate the counting operations of catches. The product is made in carton, with a plastic layer in both sides.

MODE OF USE

Ferotrap is used in food companies such as mills, warehouses, supermarkets, bakeries and in all those realities in which they are produced or stored, ground and/or their derivatives.

Ferotrap is located about 2 meters from the ground and has a coverage of about 25m².

For proper use, and therefore a true estimate, we recommend weekly monitoring in the summer period, while in the autumn, monitoring every fifteen days may be sufficient.

When the sticky surface is completely covered by catches, it should be replaced with a new one.

The trap must be kept in a cool place (temperature below 25 ° C) and dry (humidity below 55%) in order to preserve the quality of the glue present on the surface.

Technical data

Target	Ephestia kuehniella, Plodia interpunctella Tineola bisselliella
Packaging	pack of 5 in 60 pcs carton box
Code	168
