

PIASTRE COLLANTI

Caratteristiche:

Il controllo degli insetti volanti quali Ditteri e altri ordini (Coleotteri/Lepidotteri) è effettuato attraverso l'impiego di lampade a raggi ultravioletti con pannello collante. L'utilizzo di questi dispositivi consente di eseguire sia il monitoraggio sia la cattura di questi insetti in modo ecologico, igienico e silenzioso.

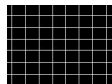

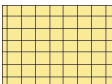

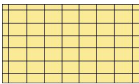

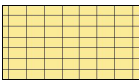

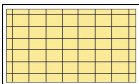

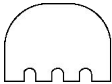

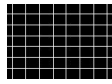

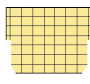

Gli insetti sono attratti dalla luce UV della lampada (fenomeno chiamato "fototropismo") e trattenuti sul pannello collante; il pannello collante consente di trattenere l'insetto evitando, da un lato, il rumore di sfrigolio tipico delle lampade a folgorazione e, dall'altro, lo spargimento di frammenti di insetti nell'ambiente.

L'impiego dei pannelli collanti permette anche il monitoraggio con conta degli insetti presenti, in modo da poter attuare mirate azioni correttive.

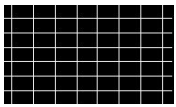

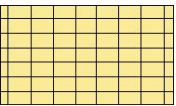

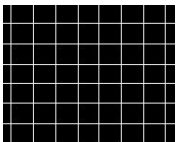

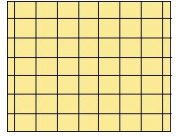

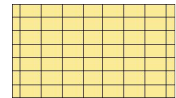

A disposizione del disinfestatore sono disponibile pannelli collanti dotati di una griglia che permette di effettuare una rapida stima del grado di infestazione. I pannelli collanti possono essere di vari colori: neri, bianchi o gialli al fine di sfruttare le peculiarità di ogni singolo ambiente (effetto cromotropico) e possono essere in cartone o in plastica.

Quest'ultima tipologia di pannello, è dedicata a quella tipologia di cliente (caseifici, mattatoi, ecc.) che utilizzando molta acqua potrebbe danneggiare il supporto della colla costituito da cartone.
